EFI Pace Custom Report Writer

Produce Presentation-quality Reports Internally and Externally through Web-based Reporting

The EFI Pace Custom Report Writer is a dynamic tool that lets you develop the reports you need and lets you format them to communicate information the right way. Powerful functionality, presented in a simple format, allows the tool to be used by many people throughout the organization.

Enables You to Develop Custom Reports in Many Different Formats
You use the same reporting tool, Crystal Clear, for all system reports, which enables you to develop custom reports in many different formats. This custom report writer is available to every user. A user with proper permission settings can create, test and add all reports to the EFI Pace framework.

Includes SQL Database and is ODBC Compliant
EFI Pace is constructed using an ODBC (Open Database Connectivity) compliant SQL database, which gives you complete access to your shop data via the Custom Reports module. You can also use Microsoft® Excel, Access, or other off-the-shelf ODBC compliant solutions to access your data (read only).

EFI Pace provides a Data Dictionary with “Common Sense” Names for Use with the Report Writer
EFI Pace uses complete and open data dictionaries with “common sense” file structures and layouts, and provides an easy-to-use structure for manipulation and analysis. The EFI Pace custom report writer module also includes formulas, stored procedures, triggers and functions that are easy to understand and extremely powerful.

Offers both Absolute and Conditional Formatting
With absolute formatting, you can put text, titles, charts, maps, columns of figures, cross-tabs and graphical images virtually anywhere on the screen. You can use pre-printed forms and optimize the report for printing or screen display. (Continued on back.)

EFI Pace Custom Report Builder

Offers both Absolute and Conditional Formatting (continued)

Conditional formatting takes you one step further by giving you the power to change the format of the data based on the content of the data itself. With conditional formatting, you can include a formula so that every time the data in a report changes, the appearance of the report changes too. A formula can make computations or otherwise manipulate the data before the system displays the result. You can create new formulas to select specific records or groups of records to appear, and you can declare and use variables in formulas that make the formulas even more useful. All of the common flow-of-control structures and mathematical formulas are always available and easy to use. Once you create a formula that you might want to reuse, you can save it as a custom function or add it to your library for future use. You may also leverage existing formulas from the standard formula repository.

Tight Integration with the EFI Pace MIS

The report writer and EFI Pace are tightly integrated and work together to support report creation, modification, distribution and viewing. This enables you to build any new reports necessary to operate your business or to change existing reports for better functionality in your shop.
