Fiery proServer

Maximize your VUTEk Printer Productivity with a Complete, Precise, High-performance Production Solution
When Color Quality and Productivity Matter

With EFI™ Fiery® proServer, you can increase the productivity of your EFI VUTEk® inkjet printer with performance-optimized server hardware, pre-installed parallel-processing Fiery XF production RIP, and color management workflow. Combined, they help you:

• Reduce idle time for operators and printers to increase profitability.

• Increase color management accuracy with advanced spot- and process-color optimization, to easily achieve stunning, precise and predictable quality prints.

• Decrease rejected prints and increase customer satisfaction.

The modular software architecture of Fiery XF grows with your business needs, and the support and maintenance agreement included with proServer protects you from future upgrade charges.

A customizable user interface and workflows streamline your print production, and tailor processes to each operator’s tasks and skill set to reduce error rates and learning curves. Seamless JDF integration with other EFI solutions, from creation to print, eliminates touch points, while improving production speed and accuracy.
Increase Performance through Optimized Server Hardware and Software

The high-performance Fiery proServer comes with Fiery XF installed – the flexible and scalable high-speed RIP and color management workflow for wide- to superwide-format production. Optimized for Fiery XF RIP and color management processes, the proServer hardware minimized processing times to maximise throughput, so you can increase your productivity and profit. Fiery XF processes multiple jobs simultaneously, rather than sequentially, for even greater performance. Plus, the user interface is still responsive to other tasks while processing jobs. Reducing idle times increases the usage of your existing equipment and resources, improving efficiency and lowering your overhead costs.
Achieve Stunning, Precise and Predictable Quality Prints

Accurate color management, with advanced spot- and process-color optimization, removes the need for time-consuming trial and error color correction or complicated device link profiles to give you best possible color output each and every time. In addition, a sophisticated visual editor provides a true WYSIWYG experience and simplifies visual color profile editing.

For the highest-quality data exchange, all X-Rite and EFI color-measurement devices use the new XRGA standard and ISO 13655-compliant measurements for the best color match under industry-standard viewing conditions. Coupled with the Fiery XF’s new Ambient Light Adaption, you will reduce the need for expensive trial-and-error reprints and increase customer satisfaction.

Future-proof your Investment with a Flexible, Scalable Solution

The modular software architecture of Fiery XF allows you to add options, such as print drivers or production features, to grow with your changing business needs.

An EFI software support and maintenance agreement, included for the first year with your proServer purchase, provides an ongoing stream of software releases, including the latest device drivers, plus all minor and major product upgrades, at a consistent and cost-effective charge. A proServer hardware warranty is also included for the first year.

With flexible options and the support and maintenance agreement, you can easily and cost-effectively keep up with new industry standards, color space definitions, and measurement devices in the ever-changing world of color management technology.
Integrate Seamlessly with Other EFI Solutions

JDF technology provides bi-directional communication between your Fiery proServer and select VUTEk printer models to reduce the risk of errors and increase your production efficiency.

The proServer can submit important printer and media-related settings like printing mode, carriage speed, curing and shutter modes directly to the printer – instead of having an operator input them at the print station. The bi-directional JDF link also provides printer and job status, as well as consumable usage, back to the Fiery proServer, making it a true centralised production hub.

The Fiery proServer also integrates with other EFI products, such as Pace™ management information system and Digital StoreFront® Web-to-Print and eCommerce solution, to create an end-to-end, automated workflow that eliminates touch points, while improving speed and accuracy.
The Extreme Approach: Display printer reveals secrets for growth thanks to Fiery proServer

“If you want to grow and be in a position to service new clients, you have to invest in the best people and the best equipment. You have to love what you do to work at Extreme. Much of our business comes from recommendations. We’re known for our quality and responsiveness – for being a group of professionals who will go the extra mile to satisfy clients’ needs. The Fiery proServer is absolutely fantastic. It lets you create color profiles so that each machine is accurately balanced, and we can build profiles for particular clients. As a result, we get better quality even on our other machines. It matches color dead on and we can easily switch from one machine to another, and the system continues to process data while the machine is printing.”

Chris Jenkins, Managing Director of Extreme Display Ltd

Streamline, Automate and Customise Workflows

The fully customisable Fiery XF user interface allows you to tailor the application to each operator’s tasks and skill set for greater efficiency and increased ease of use. In addition, downloadable default media profiles plus pre-installed presets make it easy to create automated workflows. Effective, wizard-driven color tools provide optimal color results quickly and easily. So all your operators, even novice users, have a short learning curve and lower error rate.
"We’ve been running VUTEk printers for over ten years," says Steve Hogan, President of HPI of Houston. "We’ve moved up in models from the original VUTEk PV200/600 to the QS2000, then QS3200 to the GS3200’s we own now. We added the GS5000r for even greater speed. The quality of all our printers is exceptional. We switched to the Fiery XF RIP recently, and then to the Fiery proServer to take advantage of every bit of performance from our printers” continues Steve. “Adding the Fiery proServer has cut our processing time for jobs in half over our old Fiery XF RIP system. And it’s eight to ten times faster than the ColorBurst RIP we previously used. The net gain in productivity is a 25 percent increase in throughput on each printer every day. I can’t fathom running the shop without the proServer!"

Steve explains that having the Fiery proServer has been a night and day difference in his shop performance. “Our operators used to wait on files to RIP, so they could run the VUTEk printers. With the Fiery proServer, multiple files can be ripped at the same time, so the operator never waits for a file. We stay ahead of both operators and printers. We don’t need to add personnel to increase productivity. Instead we buy the best technology.”

Increase your Return on Investment with Fiery Services

With EFI Fiery Color and Workflow Support Services, Fiery experts come on-site or dial in to your system remotely to install and perform services that make your VUTEk printer even more profitable, productive and efficient. The services include helping you produce higher color quality, optimizing your workflow, teaching you color management techniques, increasing productivity and reducing waste even more.

Contact your EFI sales representative today for additional information about Fiery XF Color & Workflow Support Services or send us an email at FieryServices@efi.com.
